0.13 Recursive Sequences

39

linear
function

$$y = mx + b$$

continuous

m = slope, rate of change,
or common difference

b = starting amount,
y-intercept or term 0

arithmetic
sequence

$$t(n) = mn + b$$

discrete

exponential
function

$$y = a \cdot b^x$$

continuous

a = starting amount,
y-intercept or term 0

b = growth factor, multiplier,
or common ratio

geometric
sequence

$$t(n) = a \cdot b^n$$

discrete

data table	term number → n $t(n)$ ← term in sequence
	always start with 1 → 1 The domain is all integers ≥ 1

values of the terms in the sequence (the numbers)

initial term
or
zeroth term
or
starting value
y-intercept

- defined as $t(0)$
- not listed as part of the sequence **but it is in the equation!**
- $t(1)$ is the first term (or first number in the sequence)
- $t(n)$ is the n th term

Review: The Language of Sequences

What does n stand for?

What does $t(n)$ stand for?

What does $t(n+1)$ stand for?

Examples

Consider the following sequences. Identify it as arithmetic or geometric. Make a table and write an equation to represent the sequence.

10, 13, 16, 19... pg 39 30, 90, 270, 810...

n	$t(n)$
1	10
2	13
3	16
4	19

$cd = 3$
 constant difference
 "cd"
 $t(n) = 3n + 7$
 $t(0) = 7$ 

n	$t(n)$
1	30
2	90
3	270
4	810

constant ratio
 "cr"
 $t(n) = 10 \cdot 3^n$
 $cr = 3$

Think, Pair, Share

A-72. Look at the following sequence:

$-8, -2, 4, 10, \dots$

$$cd = 6$$

$$t(n) = 6n - 14$$

$$t(10) = 6(10) - 14$$

- a. What are two ways that you could find the 10th term of the sequence? What is the 10th term?
- b. If you have not done so already, write an equation that lets you find the value of any term $t(n)$. This kind of equation is called an explicit equation.
- c. The next term after $t(n)$ is called $t(n+1)$. Write an equation to find $t(n+1)$ if you know what $t(n)$ is. An equation that depends on knowing other terms is called a recursive equation.

$$60 - 14$$

$$t(10) = 46$$

	explicit formula	recursive formula
arithmetic sequence	$t(n) = mn + b$	$t(n+1) = t(n) + m$ $t(0) = b$
geometric sequence	$t(n) = a \cdot b^n$	$t(n+1) = t(n) \cdot b$

HW - start it now!

Sequence	Type	Common difference or common ratio	Term 0	Explicit formula	Recursive formula
a. -4, -1, 2, 5, ...	arithmetic	cd = 3	-7	$t(n) = 3n - 7$	$t(n+1) = t(n) + 3$ $t(0) = -7$
b. 1.5, 3, 6, 12, ...	geometric	cr = 2	0.75	$t(n) = 0.75 \cdot 2^n$	$t(n+1) = t(n) \cdot 2$ $t(0) = 0.75$
d. 2, 3.5, 5, 6.5, ...	ari.	cd = 1.5	0.5	$t(n) = 1.5n + 0.5$	$t(n+1) = t(n) + 1.5$ $t(0) = 0.5$
f. 9, 7, 5, 3, ...	ari.	cd = -2	11		
g. 48, 24, 12, ...	geo.	cr = $\frac{1}{2}$	96		
h. 27, 9, 3, 1, ...	geo.	cr = $\frac{1}{3}$	81		
j. $5/4, 5/2, 5, 10, \dots$	geo.	cr = 2	$5/8$
